Pedalvision 2026

1.- <https://pedalplayground.com/>

What I like:

- Straight to the point
- easy of use
- no ask for ogiN/registers at the start pouint
- vast library of pedals/peadlboards up to date and mantained by users
- theres a way to collaborate, a somehow tedious process but has some way users contribute (see readme of the repo):

What I don't like

- It has a bug, if you change the canvas size it changes all the position of your pedals instad of recalculating positions to stay the same relations
- ugly ui/colors
- no sessions / way to save multiple pedalsboards (other that downloadign files or only conserving the latest in the localstorage)
- it looks somehow unmantained / not so much activiyt on it/imprivements

Some things/facts

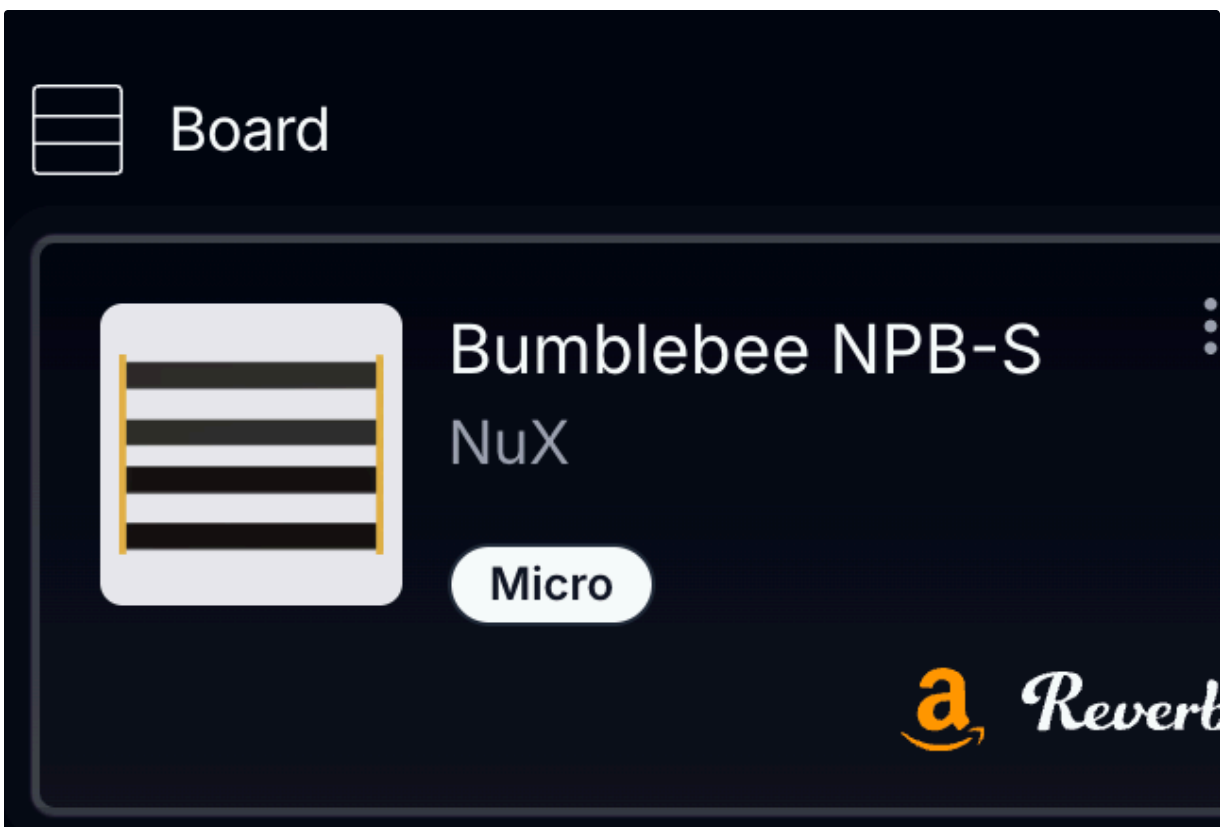

- I think they use html elements instead of <canvas>

Source Code:

2.- <https://pedalboard.app/>

What I like

- Modern UX/UI
- It has docs: <https://pedalboard.app/docs/builder> (research into them)
- It has layers: <https://pedalboard.app/docs/builder/layers>
- it has discover gear: <https://pedalboard.app/docs/builder/discover-gear>
- it has request system: <https://pedalboard.app/docs/builder/requests>
- add custom board sizing pedalboard.
- The tags like the size and also where to find it that could help to monetize this with custom link
- It has option to consider cable length

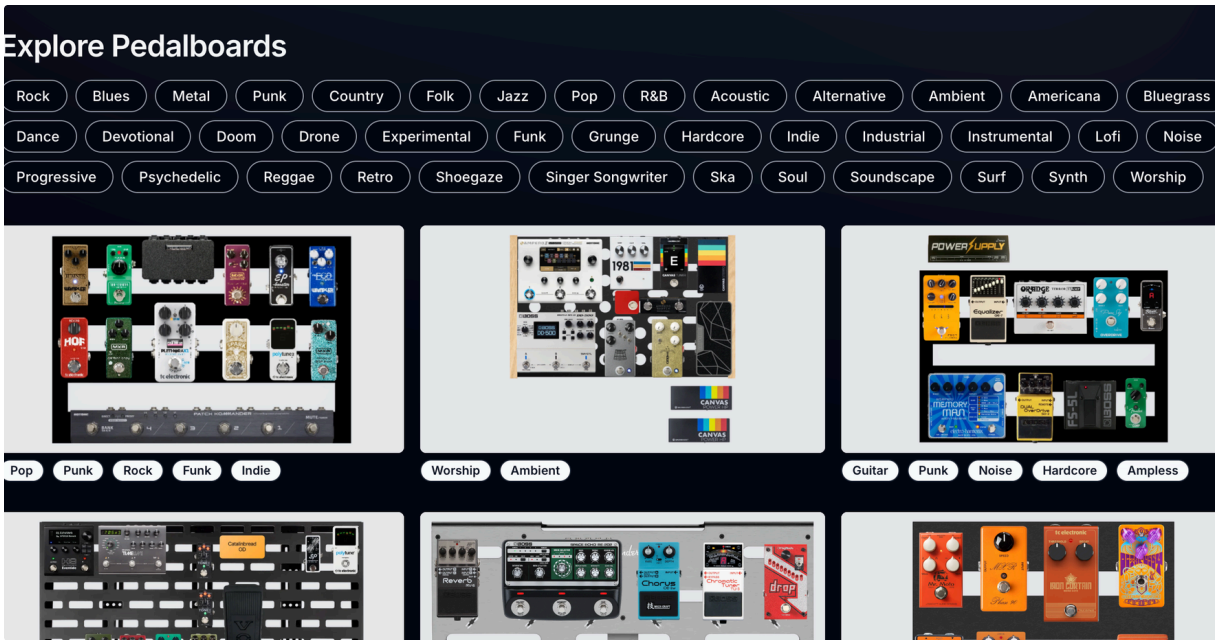

- This system tells users of space but even so allows them to place pedals (just as wanting)

- Ability to scale up/down by using the trackpad (but i would like like I said before to have multiple pedalboards, so that I like to have a canvas where i can also move in all directions, not just centered.
- Search of pedals by brand and type of effect
- Custom pedals (with ability of putting the ac power and its dimetison and otehr details)

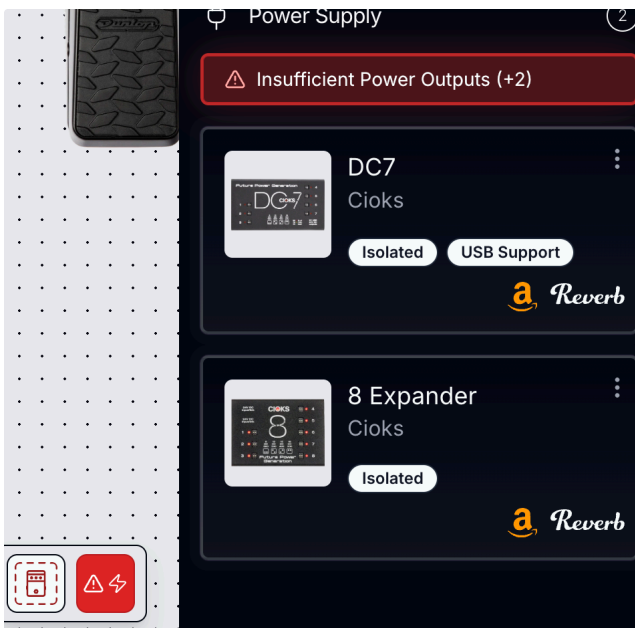

The screenshot shows a dark-themed settings window for a pedalboard. At the top, there's a section for 'Effect' with a dropdown menu currently showing 'Bit Crusher'. Below this is a 'Patch Cable Locations' section with four checkboxes: 'Top' (checked), 'Right', 'Bottom', and 'Left'. The next section is 'Power Options', which includes 'Power Input Location' with radio buttons for 'Top', 'Right' (selected), 'Bottom', and 'Left'. Below that is 'Voltage' with radio buttons for '9V', '12V' (selected), and '18V'. Then 'Power Type' with radio buttons for 'DC' (selected) and 'AC'. The 'Current' section is partially visible at the bottom.

-The main page <https://pedalboard.app/> that showcase an "Explore Pedalboards" section, but i would like for mine to show more relevant pedalboards like from famous people, the most trendig at teh moment etc. good idea by pedalboar dapp but ithink it couldl be better

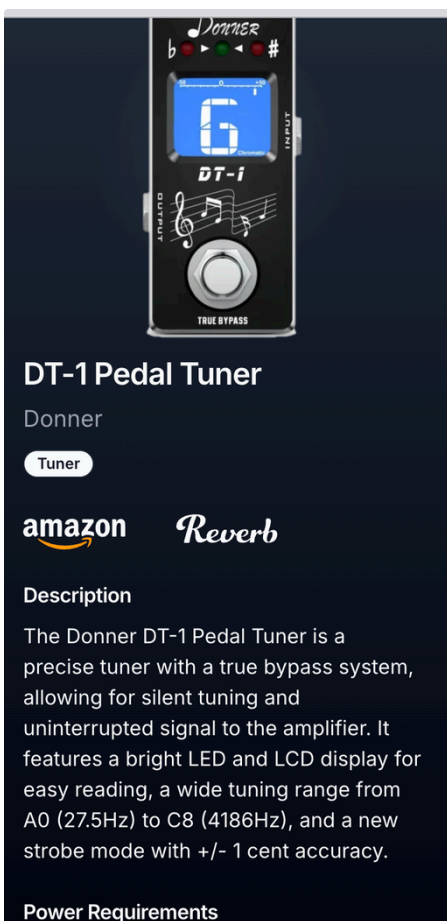

-Sessions with saved pedalboards

-power supply section and selection, showing how much energy or outputs needed (but they have some error regarding kind of polarities maybe not to focus on that, just as a very minor item for last stuff to take consideration,)

-Info about pedals and summary when you click them (ideally for our version we will show which famous people/pedalboards use them)

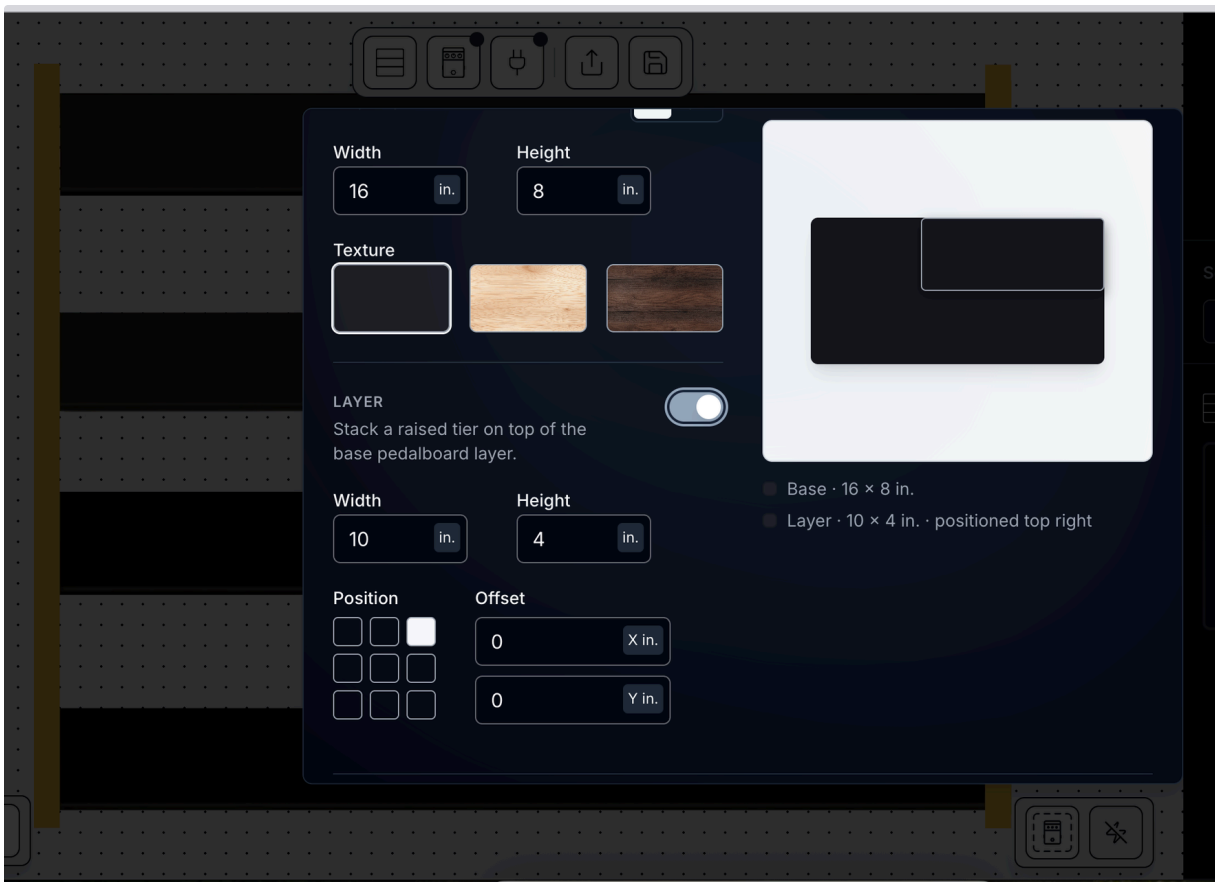

-All the tags system

What I don't like

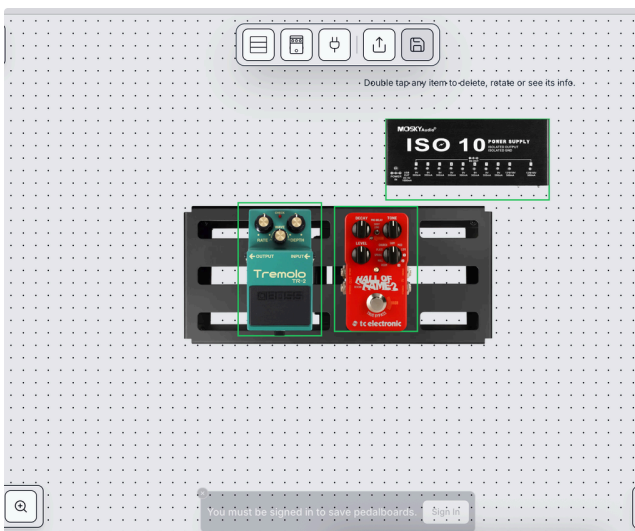

-I'm a little sceptical about the modal subsystem it has for reserach. I think its a good feature but at the same time it likes overcompicate stuff (in mobile i think it works better thou)

-I don't like the whole canvas system its based on only having ONE pedalboard in the screen at time (different that pedalplayground that allows multiple pedalboards at ones) this makes it less dynamic for comparing pedalboards or making migration projects

-I like the layer system but i dont like that its closed to only some positins:

-I don't like that the shop links doesn't seem to be locale based just us in general
 -even if it has the ability to add the cables lengths, it doesn't have a proper cable connections system.

-It uses toasts for everything haha, even for saying that you need to sign in for saving. it should redirect for example

- No Sign with google/other media available
- Even with login and so, they dont show like favorite epdalboards or so
- If a power stuff its not accomplish by oen pedla (for example bad polarity, it doesnt tell you whcih pedal has the issue)

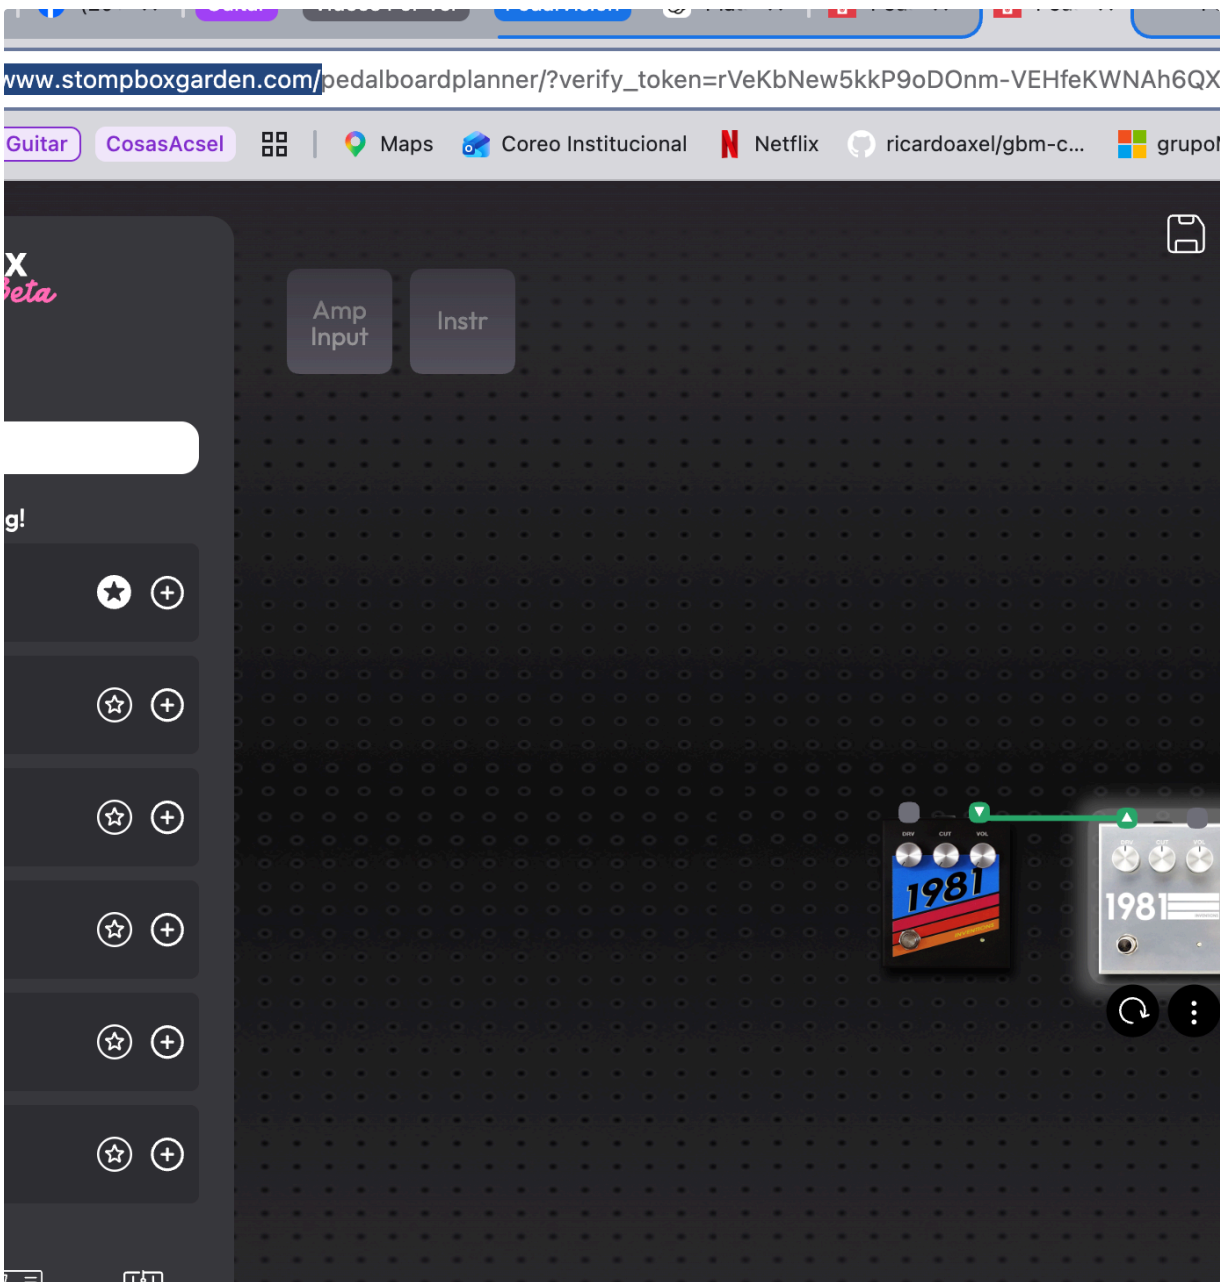

Some things/facts

- they use <canvas> not html tags

3.- <https://www.stompboxgarden.com/>

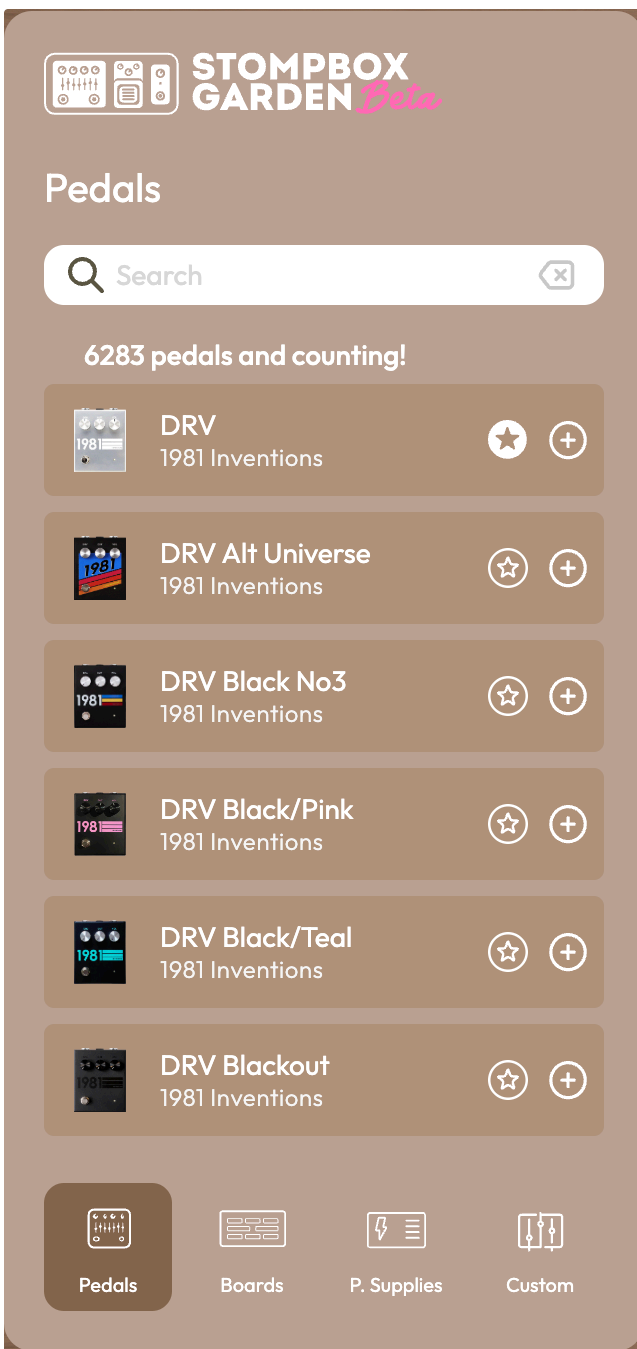

What I like:

- Cable management!

-Share links!

-I kidna like their pedal/pdealboard picker iland

-Themes!

-Custom images that could be verified by admins and shared with community, that will help to reduce the obtantion of pedal images
